

A Summary of the Nomenclature Rules of Inorganic Compounds

Ionic Compounds	Covalent Compounds	Acids																																												
<p>Metal Cations + Non-Metal Anions, or, Polyatomic Ions</p> <ul style="list-style-type: none"> • Memorize the list of ions on the next two pages. • The positively charged cation leads both the compound name and formula. • Ions are combined in simple whole number ratios to yield a neutral ionic compound. These ratios become the subscripts in the compound formula. Polyatomic ions should be encased in parentheses in the compound formula if the subscript is ≥ 2. Note that ion charges do not appear in the final formula. • Ionic compound names are obtained by simply combining the cation name with the anion name. Never use prefixes! • If the metal cation can have more than one charge, the charge must be included in the compound name – appearing as a Roman numeral in brackets (Stock system). 	<p>Simple binary compounds – only two different Non-Metal Atoms present</p> <ul style="list-style-type: none"> • The more metallic non-metal (further to the left or lower down in the Periodic Table) leads the compound name and formula. • The name of the second element always ends in <u>ide</u>. • Subscripts in compound formulas indicate actual numbers of each atom present in a molecule of the compound. • Prefixes are used in compound names to indicate the numbers of each atom present. However, the prefix “mono” is dropped if there is only one atom of the first element. Memorize the list of prefixes 1-12: <table data-bbox="798 958 1155 1169"> <tbody> <tr> <td>1</td> <td>mono</td> <td>7</td> <td>hepta</td> </tr> <tr> <td>2</td> <td>di</td> <td>8</td> <td>octa</td> </tr> <tr> <td>3</td> <td>tri</td> <td>9</td> <td>nona</td> </tr> <tr> <td>4</td> <td>tetra</td> <td>10</td> <td>deca</td> </tr> <tr> <td>5</td> <td>penta</td> <td>11</td> <td>undeca</td> </tr> <tr> <td>6</td> <td>hexa</td> <td>12</td> <td>dodeca</td> </tr> </tbody> </table> <ul style="list-style-type: none"> • <i>Exception:</i> no prefixes at all are used in the names of covalent compounds of hydrogen (e.g., H₂S is hydrogen sulfide). 	1	mono	7	hepta	2	di	8	octa	3	tri	9	nona	4	tetra	10	deca	5	penta	11	undeca	6	hexa	12	dodeca	<p>Hydrogen Cations + Non-Metal Anions, or, Polyatomic Anions</p> <ul style="list-style-type: none"> • H always leads the formula. • Acids are in the aqueous state. • Like ionic compounds, the ions in acids are combined in simple whole number ratios to yield a neutral acid. These ratios become the subscripts in the acid formula. • The acid name depends on the name of the anion involved: <table data-bbox="1386 795 1911 1039"> <tbody> <tr> <td>H⁺¹</td> <td>+</td> <td>Anion</td> <td>=</td> <td>Acid</td> </tr> <tr> <td></td> <td></td> <td><u>ide</u></td> <td></td> <td>hydro<u>ic</u> acid</td> </tr> <tr> <td></td> <td></td> <td><u>ate</u></td> <td></td> <td><u>ic</u> acid</td> </tr> <tr> <td></td> <td></td> <td><u>ite</u></td> <td></td> <td><u>ous</u> acid</td> </tr> </tbody> </table>	H ⁺¹	+	Anion	=	Acid			<u>ide</u>		hydro <u>ic</u> acid			<u>ate</u>		<u>ic</u> acid			<u>ite</u>		<u>ous</u> acid

Common Cations

Monatomic Main Group Metal Cations	Monatomic Transition Metal Cations	Polyatomic Cations
Group 1A	Cd ⁺² Cadmium	NH ₄ ⁺¹ Ammonium
Li ⁺¹ Lithium	Cr ⁺² Chromium(II)	H ₃ O ⁺¹ Hydronium
Na ⁺¹ Sodium	Cr ⁺³ Chromium(III)	
K ⁺¹ Potassium	Cr ⁺⁶ Chromium(VI)	
Rb ⁺¹ Rubidium	Co ⁺² Cobalt(II); Cobaltous	
Cs ⁺¹ Cesium	Co ⁺³ Cobalt(III); Cobaltic	
Group 2A	Cu ⁺¹ Copper(I); Cuprous	
Be ⁺² Beryllium	Cu ⁺² Copper(II); Cupric	
Mg ⁺² Magnesium	Au ⁺¹ Gold(I); Aurous	
Ca ⁺² Calcium	Au ⁺³ Gold(III); Auric	
Sr ⁺² Strontium	Fe ⁺² Iron(II); Ferrous	
Ba ⁺² Barium	Fe ⁺³ Iron(III); Ferric	
Group 3A	Mn ⁺² Manganese(II)	
Al ⁺³ Aluminum	Mn ⁺³ Manganese(III)	
Ga ⁺³ Gallium	Mn ⁺⁴ Manganese(IV)	
In ⁺¹ Indium(I)	Mn ⁺⁷ Manganese(VII)	
In ⁺³ Indium(III)	Hg ₂ ⁺² Mercury(I); Mercurous	
Group 4A	Hg ⁺² Mercury(II); Mercuric	
Sn ⁺² Tin(II); Stannous	Ni ⁺² Nickel(II); Nickelous	
Sn ⁺⁴ Tin(IV); Stannic	Ni ⁺³ Nickel(III); Nickelic <i>rare</i>	
Pb ⁺² Lead(II); Plumbous	Ag ⁺¹ Silver	
Pb ⁺⁴ Lead(IV); Plumbic	Ti ⁺² Titanium(II)	
Group 5A	Ti ⁺³ Titanium(III)	
Bi ⁺³ Bismuth(III)	Ti ⁺⁴ Titanium(IV)	
Bi ⁺⁵ Bismuth (V)	Zn ⁺² Zinc	

Common Anions

Monatomic Non-Metal Anions	Polyatomic Anions	Polyatomic Anions
Group 7A	$C_2H_3O_2^{-1}$ Acetate	OH^{-1} Hydroxide
F^{-1} Fluoride	AsO_4^{-3} Arsenate	IO_3^{-1} Iodate
Cl^{-1} Chloride	BO_3^{-3} Borate	IO_4^{-1} Periodate
Br^{-1} Bromide	$B_4O_7^{-2}$ Tetraborate	MoO_4^{-2} Molybdate
I^{-1} Iodide	BrO^{-1} Hypobromite	NO_2^{-1} Nitrite
Group 6A	BrO_3^{-1} Bromate	NO_3^{-1} Nitrate
O^{-2} Oxide	CO_3^{-2} Carbonate	$C_2O_4^{-2}$ Oxalate
S^{-2} Sulfide	HCO_3^{-1} Bicarbonate	O_2^{-2} Peroxide
Se^{-2} Selenide	ClO^{-1} Hypochlorite	MnO_4^{-1} Permanganate
Te^{-2} Telluride	ClO_2^{-1} Chlorite	PO_4^{-3} Phosphate
Group 5A	ClO_3^{-1} Chlorate	HPO_4^{-2} Hydrogen phosphate
N^{-3} Nitride	ClO_4^{-1} Perchlorate	$H_2PO_4^{-1}$ Dihydrogen phosphate
P^{-3} Phosphide	CrO_4^{-2} Chromate	SO_3^{-2} Sulfite
As^{-3} Arsenide	$Cr_2O_7^{-2}$ Dichromate	SO_4^{-2} Sulfate
Group 4A	$C_6H_5O_7^{-3}$ Citrate	HSO_3^{-1} Bisulfite
C^{-4} Carbide	CN^{-1} Cyanide	HSO_4^{-1} Bisulfate
Group 1A	SCN^{-1} Thiocyanate	$S_2O_3^{-2}$ Thiosulfate
H^{-1} Hydride
